

QUICK REFERENCE PLANTING GUIDE

LIGHT/SUN EXPOSURE	Full sun to part shade.
USDA HARDINESS ZONES	5 to 8.
PLANT TYPE	Perennial.
PLANTING DISTANCE IN-GROUND	At least 4 feet apart.
CONTAINER SIZE	One plant per 18-inch or larger container.
MATURE HEIGHT / SPREAD	4 to 6 feet tall with a 3 to 4 foot spread.
BLOOM TIME	Spring.
TIME TO REACH MATURITY	24 to 36 months.
FACTS OF NOTE	Edible berries. Self-pollinating. High in antioxidants. Blueberries are delicious when eaten fresh, preserved or used in desserts.

SOIL PREPARATION

We recommend having your soil tested periodically by your local County Extension Office (www.nifa.usda.gov/extension or by calling 1-800-333-4636). A soil test can determine if your soil needs any amendments to enhance the growth and performance of your plants.

Ideal garden soil is easy to dig in and drains well while still holding the nutrients and water vital to plant growth. To prepare a bed for in-ground planting, spade or till the soil to a depth of roughly 12-18 inches. Next, spread a 2-4 inch layer of organic matter such as compost, shredded leaves or peat moss over the soil and mix well.

Cottage Farms' Guarantee

We aren't happy if you aren't happy. Cottage Farms warrants its perennials for 1 year and annuals for 90 days from the time of the shipment. If for any reason you are dissatisfied, Cottage Farms will replace your plant with a similar or comparable one at no charge. If your replacement is not available or it is too late in the season to ship, it will ship the following shipping season.

Caution: Do not assume any plant is safe to eat. Only parts of plants expressly grown to be eaten should be considered edible. As with any product that is not food, care should be taken to make sure that small children and pets do not ingest any part of a plant that is not expressly grown to be eaten.

Unless specifically stated, this product is intended for ornamental horticultural use only and is not intended for consumption or ingestion by humans or pets. Most plants are harmless but some contain toxic substances which can cause adverse health effects. Furthermore, some individuals and some animals are sensitive or allergic to certain plants and precautions should be taken to limit or avoid physical contact with particular plants. Some plants have thorns or spines that can be painful if handled.

**In case of ingestion contact a poison control center immediately.

OUT OF THE BOX

BLUEBERRIES
SKU #M53276

Your plants have been shipped to you in pots. Please remove the plants from the packaging right away and plant them as soon as possible following the planting instructions below. If it is not possible to plant them right away, follow these important steps:

1. Roll the plastic down around each plant and place them in a sunny location.
2. Keep the plants well watered.

Note: Some leaves may appear wilted or yellow upon arrival. This is due to the stress of shipping and is nothing to worry about. Water the plant and let it recover for few days, then gently remove any foliage that does not recover to allow for new growth.

SHIPPED IN A 7-INCH POT.
PLANT SIZE MAY VARY BASED ON GROWING CONDITIONS.

PLANTING INSTRUCTIONS

Important: Thoroughly hydrate the plant by submersing the root zone in a container of water for 10 minutes while you prepare for planting.

1. Remove and discard the clear plastic bag from around the pot.
2. After watering, separate the root ball from its pot by holding the plant upside down in one hand and squeezing the sides of the pot with the other.
3. Prepare the root ball for planting by gently disturbing the surface roots with your fingers, fork, or gardening tool and pruning any damaged roots. This will encourage the roots to begin growing outward into the new soil.
4. Dig a hole twice as deep and twice as wide as the plant's root ball. Partially backfill the hole with soil and place the plant into the hole. The top of the root ball should be level with the ground surrounding the hole. Refill the hole with soil, firming the soil around the plant with your fingers. Check to be sure the plant is not planted too deeply. If it is, raise the plant carefully and re-firm the soil.
5. Water thoroughly.

CONTINUING CARE

WATERING	<p>Adequate and consistent watering is essential during your plant's first year in the garden. Infrequent, long soakings of water that thoroughly saturate the soil are more effective than frequent, light applications of water.</p> <p>Due to variable geographical and environmental conditions, a specific watering schedule is difficult to define. However, as a rule of thumb, you should not allow the soil to completely dry out. During the first summer, you may need to water as often as every day in periods of drought and extreme summer heat. To determine if your plant needs water, dig a few inches into the soil next to the plant. If the soil is dry 2-3 inches below the surface, it is time to water.</p> <p>Overwatering can be as damaging as under watering. Be sure that the area surrounding your plant has adequate drainage to move water away from the plant. If you choose to plant in a container, always select one with drainage holes to prevent your plant's roots from sitting in water.</p>
WEEDING	<p>Keep the area around your plants free of weeds. Weeds compete with surrounding plants for food, water and light. Walk around the garden periodically and pull weeds, including the roots, as soon as you see them.</p>
MULCHING	<p>Apply a 2-4 inch layer of shredded bark, compost, leaves, straw or other organic matter around your plants to promote moisture retention, maintain even soil temperatures and discourage weed growth. Replenish the mulch as needed.</p>
FEEDING	<p>Feed your plants once every 2-3 weeks during the growing season with a water-soluble fertilizer such as Cottage Farms' Carefree Bud-N-Flower Booster for Acid Loving Plants (SKU #M10831). Discontinue feeding after September 1st so your plants can harden off for winter dormancy. Resume fertilizing when new growth appears in the spring.</p>
HARVESTING	<p>Harvest the berries when they have turned from red to blue. Blueberries do not continue ripening once they have been picked, so avoid harvesting until they are fully ripe. When the berries are ripe, they should feel firm but not hard and come off the plant with minimal effort. Harvesting early in the morning while the weather is still cool prolongs the shelf life of the berries. After picking, store the berries in a refrigerator and do not wash them until you are ready to use them. The sweet, nutritious berries can be eaten fresh, preserved or used for cooking.</p>

CONTINUING CARE (Continued)

PRUNING	<p>Blueberry plants do not need to be pruned for the first three years after planting except to remove dead or damaged growth in early spring.</p> <p>In early spring of the fourth year, prune your blueberry bushes while they are still dormant. Remove dead and weak branches, and prune interior crossing branches to allow light to reach the center of the plants. Prune off any low growth that would touch the ground if weighed down by fruit.</p> <p>In years following, thin out older canes in order to force new, more vigorous growth. Select two of the oldest, most unproductive canes to remove each year. This type of yearly pruning improves the quality and quantity of the fruit.</p> <p>Flower buds are produced on tips and down the stems of year-old wood. Blueberry bushes tend to produce smaller berries when they are overloaded with fruits. Flower buds can be thinned in early spring to prevent the plant from becoming overloaded and to improve fruit quality.</p>
WINTERIZING	<p>Watering thoroughly in late fall will greatly enhance your plant's cold tolerance once the ground has frozen. Blueberries are very hardy, but will benefit from mulching in cold areas. The time to winterize your plants is in late fall. When winterizing your blueberries, keep in mind that the root system is the most vulnerable part of the plant. Mulch heavily by mounding a 6-8 inch layer of shredded bark, compost, leaves, straw or other organic material around the base of each plant.</p> <p>In very cold areas, containerized plants should be brought into an unheated, protected area such as a garage or cellar before temperatures drop below freezing. Check soil moisture every 2-3 weeks and water as needed during winter.</p> <p>In spring, remove mounded soil or mulch from in-ground plantings. Containerized plants should be moved back out into the garden sunlight where they will begin to repeat their yearly garden performance.</p>

FREQUENTLY ASKED QUESTIONS

Is cross-pollination necessary for my plant to produce fruit?
No. The varieties we offer are self-fertile, so they do not need to be cross-pollinated to produce fruit.

What is a chill hour? Does my plant need them?
A chill hour is defined as any hour where the temperature is below 45°F. Blueberries need chill hours to produce fruit, though the number of chill hours needed varies between varieties. As long as the variety you ordered is appropriate for your hardiness zone, it should receive enough chill hours to produce a crop in your area.
